Polling Intervals by Broker

Oct 21, 2026 · @Swarmer

One table per broker: what polls it, and how often.

SnapTrade

No live stream — everything is polling. Limit is 250 requests a minute, shared across all users.

What polls it	How often
Order feed — the main listener	every **5s** per trader (60s if the webhook is on)
Order status refresh for subscribers	every **30s**, one call per unfilled order
Fill nudge after we place an order	a resync **straight away**, then reads at **+4s** and **+10s**
P&L and positions	every **60s** — 3 min when the market is closed
Account balance	every **15 min**
Daily P&L snapshot	every **hour**
Positions page in the browser	every **30s**, only while the tab is visible
Positions page after an order	4 extra refreshes at **1.5s, 6s, 18s, 35s**
Brokers and Calendar pages	every **30s**

Direct Alpaca

Traders get order events on a live stream, so polling is mostly P&L. Limit is 200 requests a minute per account — plenty of room.

What polls it	How often
Order events for traders	**live stream** — no polling
Order status refresh for subscribers	every **30s**, one call per unfilled order
P&L and positions	every **10s** — 3 min when the market is closed
Retrying orders the broker rejected	every **10s**, only when one is due

What polls it	How often
Cancelling orders that sat unfilled too long	every **15s**, only when one is past its timeout
Trailing stops and trail-down repricing	every **1s** and **15s** — prices come from our own cache, no Alpaca call
Account balance	every **15 min**
Daily P&L snapshot	every **hour**
Positions page in the browser	every **10s**, only while the tab is visible
Positions page after an order	4 extra refreshes at **1.5s, 6s, 18s, 35s**
Brokers and Calendar pages	every **30s** and **10s**

Direct Webull (OpenAPI)

There is a live stream, but the order poll keeps running alongside it as a second channel. Limit is 2 requests every 2 seconds per endpoint — so what trips it is two calls landing together, not the total for the minute.

What polls it	How often
Order events	**live stream**
Order list — runs alongside the stream, always	every **15s**, one account at a time, spaced out across the cycle
Order list when the market is closed	every **2 min**, or **20s** if orders are still working
P&L and positions	every **15s** — 3 min when the market is closed
Order status refresh for subscribers	every **5s** if that account traded in the last 90s, **30s** otherwise — off unless direct Webull is turned on
Repeat position reads	reads within **2s** of each other reuse the same answer
Account balance	every **15 min**
Daily P&L snapshot	every **hour**
Positions page in the browser	every **30s**, only while the tab is visible

What polls it	How often
Positions page after an order	4 extra refreshes at **1.5s, 6s, 18s, 35s** — these skip the 2s reuse and are what usually causes a 429
Webull usage panel	every **15s** — reads our own counters, never calls Webull
Brokers and Calendar pages	every **30s**

Webull is the only broker where you can see the real numbers: open `GET /api/brokers/webull-usage?minutes=60` for a count of every request in the last hour, split by what caused it.
